I N T R O D U C T I O N

In order to comply with the provisions of the State Financial District Law, the Montana Department of Highways has the responsibility to evaluate the condition of the Federal Aid Primary System throughout the State for the purposes of allocating construction funds to the various financial districts. In 1948, a formula was developed to determine the relative deficiency of each section of highway for this purpose, which was based largely on a comparison of the existing condition of the highway with the latest design standards. The deficiency ratings thus obtained were also converted to priority ratings by the application of a traffic volume factor.

During recent years, other states have developed newer formulas for appraising the sufficiency of highways in those states, and since it was apparent that these formulas provided a better basis for evaluating highway conditions, the various formulas were studied with the objective of developing a new formula for Montana that would improve our rating procedure. This study resulted in a new sufficiency rating procedure, which is used in determining the allocation of construction funds to the financial districts and as priority-rating guide for programming of new construction projects.

This 1972 report is the first to be compiled by fully utilizing the Highway Information System data bank. All items used in the sufficiency formula with the exception of the condition of pavement, foundation and drainage were extracted from the data bank.

The sufficiency rating procedure applies only to rural sections of the Federal Aid Primary System highways. It is not adaptable to urban sections of highway because of the special traffic capa-

city conditions encountered in the cities, and for this reason, the urban sections of highway continue to be rated on the basis of the older formula until such time as a new urban sufficiency rating procedure can be devised.

A total of 5211.6 miles of Primary highways rated in this report is composed of 4988.2 miles of rural and 223.4 miles located within municipal and urban areas.

A completely adequate section of rural highway is assigned 100 points in the sufficiency rating formula. As defined for this study, a section of highway meriting a rating of 100 points must have a thoroughly sound structure, must be free from those hazards that can be eliminated by proper road design and must have adequate capacity to satisfactorily handle existing traffic demands.

The following factors were considered in the sufficiency formula.

A. Structural Adequacy -- Total 50 Points

1. Foundation 10 Points
2. Surface 30 Points
3. Drainage 10 Points

B. Safety -- Total 20 Points

1. Number of stopping sight distances, shorter than permitted by design speed.
2. Number of horizontal curves, sharper than permitted by design speed.
3. Number of bridges narrower than the width of the traveled-way of approaches.
4. Average accident rate during the current year.

C. Hourly Service Volume (Traffic Capacity)-- Total 30 Points

1. Design hour traffic volume for the current year.
2. Pavement and shoulder widths
3. Percent of commercial vehicles
4. Length of no passing zones
5. Design speed
6. Average highway speed

Structural adequacy was determined by a field inspection of the entire system. To insure uniformity, this inspection was made by one man who had been schooled in rating techniques. Field measurements of pavement and roadway widths were also made during this inspection, as a check on existing records. The foundation of a section of highway was assigned points in the field between a maximum of 10 if it was considered adequate, and 0 if it was totally inadequate. Surfacing was rated and assigned points between 30 if excellent, and 0 if extremely poor. Drainage was also assigned points between 10 and 0 in the same manner as foundation and surfacing.

Factors affecting the safety rating, such as inadequate stopping sight distances, narrow bridges, and excessive horizontal curves, were obtained from the road plans and straight line diagrams. The traffic accident rate for the current year was computed for each section on the basis of the number of accidents per 10,000,000 vehicle-miles of travel. The traffic accident rate in future reports will be based on a three year average when the accident data bank file has accumu-

lated three years information. A maximum of 20 points for safety was assigned to a section of highway if stopping sight distance is adequate, there is not excessive curves or narrow bridges and the accident rate was below average. Conversely, the safety rating was reduced proportionately from 20 to 0 points by existence of any of these items.

The hourly service volume (traffic capacity) of each section of rural highway has been computed by the approved method for rural highways outlined in the new Highway Capacity Manual. This method takes into consideration such items as width of pavement and shoulders, percent of trucks, length of nopassing zones, and design and average highway speeds.

The capacity rating expresses the relationship between the traffic volumes presently using the section of road and the ability of the section to accomodate such traffic. The rating is best described as the relationship between the computed Service Volume (SV) and the Design Hourly Volume (DHV). A capacity rating between 15 and 30 would indicate at least a Level of Service B. Ratings less than 15 would indicate that the volumes are exceeding the volume/capacity ratio that permits free flow at the desired speed.

A total basic sufficiency rating of a section is the sum of the following individual ratings.

Item	Range of Points
Foundation	0 to 10
Surface	0 to 30
Drainage	0 to 10
Safety	0 to 20
Capacity	0 to 30
Total Rating	0 to 100

The adjusted sufficiency rating has been computed to establish priorities for sections of highway falling into the same general sufficiency rating category. The total basic sufficiency rating is adjusted by comparing the average daily traffic carried by a rating section, with the average for the system. This adjustment gives some additional priority to a section of highway carrying above-average traffic volumes.

The curves shown on page 6 were plotted by accumulating the miles of rural primary highway in each adjusted sufficiency category and the miles of highway in each age group. The two curves are quite similar.

The sharp break in the sufficiency curve, at about 40 percent, indicates that approximately 350 miles, or seven percent, of rural primary highways located in all sections of the State are in a critical category and should probably be constructed immediately, if funds are available. These sections are shown in red on the State map on page 8. The next noticeable break in the sufficiency curve occurs at about 60 percent. There are approximately 2,446 miles of rural primary highway that are 60 percent or less sufficient and 2,096 miles that are rated between 40 and 60 percent. It may be assumed that 2,096 miles, or 42 percent, of our rural primary highways rated between 40 and 60 percent sufficient are approaching obsolescense and probably should be improved within the next five to ten years. The approximate location of this mileage is also shown in blue on the State map on page 8. Mileage rated between 61 and 100 percent sufficient is considered to be in tolerable to excellent condition. This category includes 2,542 miles of rural primary highways or 51 percent of

ADJUSTED SUFFICIENCY RATINGS

the system.

The curve on page 6 which illustrates the age of the rural primary system, indicates that approximately 696 miles of highway, that were in use as of December 31, 1972 are at least 40 years old. The same curve shows that 2,351 miles of highway, or about 47 percent of the total rural primary system, are now at least 25 years old.

The chart on page 7 is of historical interest in that it shows the miles of rural Federal Aid Primary highway constructed by years.

The tabulation on the following page shows the miles of rural highway in each financial district by adjusted sufficiency ratings. The tabulation on page 11 summarizes the equivalent deficient mileage by financial districts and also indicates the percentage of deficient mileage that were used to allocate State construction funds to the 12 financial districts for the fiscal year beginning July 1, 1973.

The tabulation of total miles, percent deficient and equivalent deficient miles by rural Federal Aid Primary Routes appears on page 12.

Strip maps of each Federal Aid Route showing the location of each rating section and the rating assigned in all categories of the formula are included in the first section of this report. The beginning of each section has also been tied to our milepost numbering system to aid in locating any particular section. The "year built" and "year improved" have been added to each rating section. The "year built" is the date that the existing section was constructed or fully reconstructed while

the "year improved" indicates the date of the last major improvement on a section by maintenance betterment or construction.

Sufficiency ratings have been tabulated on a statewide basis by rating sections in ascending order by adjusted sufficiency ratings. These same tabulations are also included for each of the twelve financial districts along with a map of each district which shows the location of sections rated from 0 to 60 percent.
